SUMMARY

Backend engineer with 2 years of production experience owning the core API of a live EV battery-swap platform serving multiple operator classes. Strength in REST API architecture, geospatial and IoT-telemetry systems, payment integration, and PostgreSQL performance — with full-stack delivery in React / Next.js. Backed by a competitive-programming foundation (4× ICPC Asia Preliminary) and a bias toward reliable, transaction-safe systems.

EXPERIENCE

• Cassetex (EV Battery-Swap Platform)

Associate Software Engineer

February 2025 – Present

Mohakhali DOHS, Dhaka

- Own the platform's core REST API (Laravel 12 / PHP 8.2 / PostgreSQL), delivering 150+ endpoints across fleet operations, IoT telemetry, payments, geofencing, and hardware control through a scalable service-oriented architecture.
- Built a real-time geofencing system for EVs that automatically shuts down a vehicle when it leaves its permitted zone and re-enables it on return using GPS tracking and Tile38, with an automatic fallback that keeps enforcement working during network outages.
- Engineered an ACID-safe order and payment platform with atomic multi-record transactions, rollback guarantees, and priority-based payment resolution across wallet and swap-credit balances, eliminating partial-write and double-charge scenarios.
- Designed and secured three authentication flows on a unified API surface (Azure AD SSO, driver PIN authentication, and scoped IoT API keys), complemented by custom RBAC middleware and comprehensive audit logging.
- Delivered the operator-facing platform end-to-end, including a Next.js 15 admin dashboard with a custom geofence editor, telemetry analytics, permission-aware UI rendering, and an installable field-officer PWA.
- Automated operational reporting through a Python-based data pipeline (pandas, openpyxl, Microsoft Graph API) and integrated bKash payments with idempotent, race-condition-safe reconciliation workflows.
- Managed deployment and server operations across three VPS environments (two production, one staging), including Nginx configuration, environment setup, SSL certificates, Git-based releases, PostgreSQL provisioning, backups, queue workers, cron jobs, and production incident handling.

• Eutropia IT

Junior Software Engineer

July 2024 – December 2024

Mohammadpur, Dhaka

- Built client-facing Laravel + React / Next.js applications end-to-end in a cross-functional Agile team, from requirements gathering through deployment.
- Refactored three legacy modules with cleaner object-oriented patterns, eliminated N+1 query issues, and introduced targeted indexing to improve API response times; resolved production bugs under time pressure and maintained clear technical documentation.

PROJECTS

• DevBoard — Multi-Tenant Project Management SaaS

Laravel, Next.js, TypeScript, PostgreSQL, Docker, GitHub Actions

2026

[\[live demo\]](#) [\[repo\]](#)

- Built a workspace-scoped multi-tenant SaaS with role-based access control (owner/admin/member/guest) and per-project membership gating, enforced through a shared authorization layer across all controllers. **Demo:** demo@devboard.app / demo1234
- Engineered an event-driven automation rule engine — configurable per-project triggers (task created, status changed, assignee added, due-date reached) firing async actions (status change, assignment, labeling, notifications) via queued jobs, with a persisted execution log.
- Built a production-grade outbound webhook system: HMAC-SHA256 signed payloads, exponential-backoff retries (3 attempts, 30/120/300s), and a per-delivery audit record capturing HTTP status and response body.
- Integrated GitHub (personal access token) with task-to-issue linking and inbound webhook sync that updates task state on PR merge.
- Added Pusher-based real-time updates with a polling fallback, and shipped a containerized CI/CD setup — multi-stage Docker build, GitHub Actions running PHPUnit against a real Postgres service plus lint/type-check, deployed to managed services (Render / Neon / Vercel).

SKILLS

- Backend:** PHP (Laravel), REST API Design, OOP & SOLID, JWT / Sanctum Auth, Laravel Queues & Observers, Python (Automation/Scripting)
- Frontend:** React, Next.js (SPA / SSR), TypeScript, JavaScript, TailwindCSS
- Databases:** PostgreSQL, MySQL — schema design, query optimization, indexing; PostGIS / Tile38 geospatial; Redis
- DevOps:** Docker, GitHub Actions CI/CD, Nginx, Linux / VPS administration, SSL, deployment & release management, monitoring
- Practices:** Agile/Scrum, Git, REST integration, code review

CERTIFICATIONS

- IBM DevOps and Software Engineering Professional Certificate — IBM

EDUCATION

• B.Sc.(Engg) in Computer Science and Engineering

University of Asia Pacific

June 2020 – June 2024

Dhaka, Bangladesh

- CGPA: 3.60 / 4.00 | Academic honours: Vice Chancellor's Award (Fall 2020), Dean's Award (Fall 2022).

ACHIEVEMENTS & ACTIVITIES

- Competitive Programming:** 4× ICPC Asia Preliminary participant (2020–2023); 4th, Intra-UAP Programming Contest (2022).
- Volunteer:** ACM ICPC World Finals Dhaka (2022); Ada Lovelace Celebration organized by BdOSN (2022).
- Leadership:** Event Coordinator & Executive, UAP Film & Photography Club (2022–2024).
